Base station power principle inside the new energy battery cabinet

What is the traditional configuration method of a base station battery? The traditional configuration method of a base station battery comprehensively considers the importance of the 5G base station, reliability of mains, geographical location, long-term development, battery life, and other factors. What happens when a base station is in active state? 1) When the base station is in active state, its power loss  $P_{active}$  consists of transmitting power  $P_{tx}$  and inherent power  $P_{fix}$ . With an increase in the communication load of the acer station, the corresponding transmitting power  $P_{tx}$  increases linearly. What is the sleep mechanism of a base station? The sleep mechanism of a base station refers to the intelligent shutdown of major power consumption devices, such as the AAU of the base station, when there is no load or the load is low, such that the energy consumption is greatly reduced. Can a bi-level optimization model maximize the benefits of base station energy storage? To maximize overall benefits for the investors and operators of base station energy storage, we proposed a bi-level optimization model for the operation of the energy storage, and the planning of 5G base stations considering the sleep mechanism. Why does a base station have a low power load? Therefore, when the electricity price was at its peak, the base station system had a low power load and would discharge to the grid in part of the time. Conversely, when the electricity price was at its low, the base station system had a high power load. Are lithium batteries suitable for a 5G base station? 2) The optimized configuration results of the three types of energy storage batteries showed that since the current tiered-use of lithium batteries for communication base station backup power was not sufficiently mature, a brand- new lithium battery with a longer cycle life and lighter weight was more suitable for the 5G base station.
