When the output is at logic high level, diode D2 will conduct and the current will pass through diode D1, R3 to the base of transistor Q1. Thus transistor Q1 will be switched on. When the output is at logic low level, diode D1 will co When this device is powered using the 12V battery, the 555 timer connected in astable mode produces square wave signal of 50Hz frequency. When the output is at logic high level, diode D2 will conduct and the current will pass through diode D1, R3 to the base of transistor Q1. Thus transistor Q1 will be switched on. When the output is at logic low level, diode D1 will conduct and current will flow via and D1 and R4 to the base of Q2, causing it to be switched on. This allows the DC voltage to be produced across the primary of the transformer at alternate intervals. The capacitor ensures that the frequency of the signal is at the required fundamental frequency.
